

Can Google see your **whole website?**

Google could see about 25 pages of my website. By early September, it was 516.

That's The Mounting Man, my TV mounting company. Here's the number I checked and what I built after I saw it. It's one page because it's one idea: Google can only show people the pages it knows exist.

STEP 1 Check your number (about 10 minutes)

- ☐ Set up Google Search Console for your website. It's a free tool from Google that shows how Google sees your site.
- ☐ Verify that you own the site. Search Console walks you through it.
- ☐ Open the **Pages** report under Indexing.
- ☐ Write down how many pages Google has indexed. That's your number. _____

If the number is tiny, Google is seeing a tiny business. Mine was. My homepage was a bare landing page with no menu, so Google had almost nothing to follow.

STEP 2 What I built next

- ☐ **A real menu.** Every page on the site can be reached from the menu, so Google can follow it.
- ☐ **A page for each service.** Give the harder jobs their own pages. For me that's above-fireplace, stacked stone, tile, and corporate installs.
- ☐ **A page for each area you serve.** One page per town or city you actually work in.
- ☐ **A short post for every job you finish.** Include the town, what you installed, the wall or surface, and real photos. For me, one job is one post.

STEP 3 Check again

- ☐ Come back to the Pages report after the new pages go up, and write down the new number. _____

Mine went from 344 pages on June 29, 2026 to 516 on September 3, 2026. The biggest jumps came as the city pages and install posts went in. I didn't live in Search Console. I looked at that number now and then and watched it climb.

OPTIONAL One more look

- ☐ Open the **Performance** report and look at the searches you show up for. Wording matters. "TV mounting service Minneapolis" did well for me. "TV mounting Minneapolis" was much harder, because it's crowded.

What's your number? Reply in Messenger with how many pages Google shows for your site, and I'll tell you what I'd look at first.
